Aran: weak spot fixes (4 November 2026)

This follows the live link check and weak spots report. Everything below is on one branch and one pull request; nothing reaches the live site until that pull request is merged.

What was fixed

Weak spot (report section)	What changed	How it was checked
2.1 Two finished pull requests unmerged and clashing	The code audit fixes (PR #13) and the real-data work (PR #14) are combined here with their four conflicts resolved: the real-data version of `aran_cloud/main.py` and `demo_bank/app.py` (no demo seeding, fresh test identities), `scripts/seed_demo.py` deleted, both Learn docs kept in `README.md`	Full suite below
2.5 Names and addresses, flaky test	The bank's customer names go into the keyed registry (lower-cased, so any letter case matches) and are removed on erasure. Name and address **fields** (`applicant`, `customer=`, `addr=` and so on) and free-text addresses ending in a PIN are taken as one whole finding	The flaky test now passes 250 runs in a row (it failed about 3 in 10). Customer names in capitals: 6 of 6 missed before, 0 of 6 now. On 3,000 synthetic log lines, addresses left raw went from 34 to 28 of 498, with no new false name or address findings
2.4 No CSP on the demo banks	Both banks send the console's headers: CSP, `nosniff`, Referrer and Permissions policies, COOP. The side-by-side page frames both banks and calls Aran Cloud, so those origins are allowed; `ARAN_CONNECT_SRC` adds more	New test; headless Chromium on Bank A, Bank B and the side-by-side page with 0 console errors
New bug found while testing	Bank B's "Fill a test identity" made cards starting 56 to 59. They pass Luhn but belong to no card network, so Aran left them alone and **Bank B stored about one card in four raw**. Cards now start with 4 or 51 to 55	The bank smoke test failed 3 times in 12 before, 22 of 22 passed after; 40 sign-ups at both banks then left no raw card in Bank B's database (`test_plaintext_scan_beyond_core_after_seed` passes)

Weak spot (report section)	What changed	How it was checked
2.7 Roadmap out of date	`docs/research/aran-roadmap.md` and its copy in `artifacts/Roadmap` now open with a status table for all 14 items	Read against the code

Test results on the combined branch

Suite	Result
Core (`app/server`)	15 passed (3 new)
Aran Cloud	24 passed, 1 skipped, plus the lockdown test against a locked core
Python SDK	11 passed
Demo banks	50 passed (2 new)
Research	58 passed, 1 skipped; the persistence scan 12 of 12 with bank data present
Smoke tests	core 11 of 11, Cloud 12 of 12, banks 9 of 9

Still open (needs a person or money)

1. **Merge the pull request**, then rotate the hosted `ARAN_INTERNAL_SECRET` on Render (Bank B used to forward it to Cloud). After merging, PRs #13, #14 and #15 can be closed.
2. **Keep-awake**: add a free outside pinger (UptimeRobot or cron-job.org) on `aran-console.onrender.com/api/health` and `aran-apps.onrender.com/healthz` every 5 minutes. This needs an account, so it is yours to set up.
3. **Hosted data resets on restart**: needs a Render disk or a free Postgres.
4. **Staff login on the banks, Vite 6 upgrade**: not done here.
5. **Names of strangers** in free text with no cue word: still a model problem (GLiNER, roadmap item 7).
