BUILDX HACKATHON

PITCH DECK

Aran

A firewall for personal data in motion. It swaps identifiers for safe tokens before any log, vendor or AI ever sees them.

TEAM ID

To be added

TEAM NAME

Team Aran, KARE

PROBLEM STATEMENT

Prevent Sensitive Data Leakage

NITI Aayog | ATAL INNOVATION MISSION | Crescent Innovation Incubation Council (A Section 8 Company Under Companies Act 2013) | AIC Crescent Innovation Incubation Council | B.S. Abdur Rahman Crescent Institute of Science & Technology Deemed to be University u/s 3 of the UGC Act, 1956 | ATAL INCUBATION CENTER | t-hub

The Problem

Who faces it

Every organisation that holds personal data. It leaks through logs, vendor copies and AI chatbots.

Why it matters

India's DPDP Act allows fines up to ₹250 crore, and its duties begin on 13 May 2027.

How they deal with it today

Pattern filters and masking. One OTP pattern raised 67,481 false alarms on 32,000 real log lines.

₹22 cr

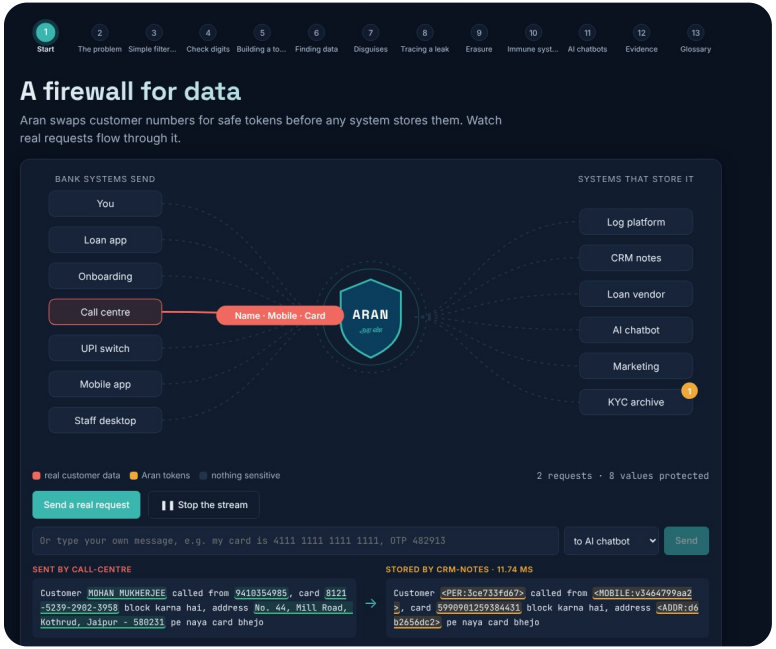

Average cost of one data breach in India

Source: IBM Cost of a Data Breach, 2025

Our Solution

Aran sits on every path data leaves by and swaps identifiers for look-alike tokens.

- Tokens always fail the check digit, so anyone can tell protected from leaked
- Each destination gets its own tokens, so a leaked file names its source
- One key per person and purpose: erasing data is one key deletion, with a receipt

How It Works

1

Connect

Point logs, APIs, exports or AI prompts at Aran with one URL or the SDK

2

Detect and swap

Check-digit maths, AI models and registries find identifiers and swap them

3

Only tokens leave

Vendors, logs and AI see tokens. Leaks are traced and erasure is proven

What Makes Us Different

Pattern filters and masking

- False alarms bury the real leaks
- Tokens look exactly like real numbers
- Masks still leave few enough guesses
- Deleting rows misses backups and vendors

VS

Aran

- Maths and calibrated AI: alarms 2,506 to 60
- Tokens provably fail the checksum
- A ledger budgets what systems learn together
- Shred one key, get a quantum-safe receipt

Proven on Real Data

91%

Values removed

On 16,000 unseen real log lines; plain regex removes 46%

0

Tokens taken as real

Out of 20,000 tokens mixed into real logs

100%

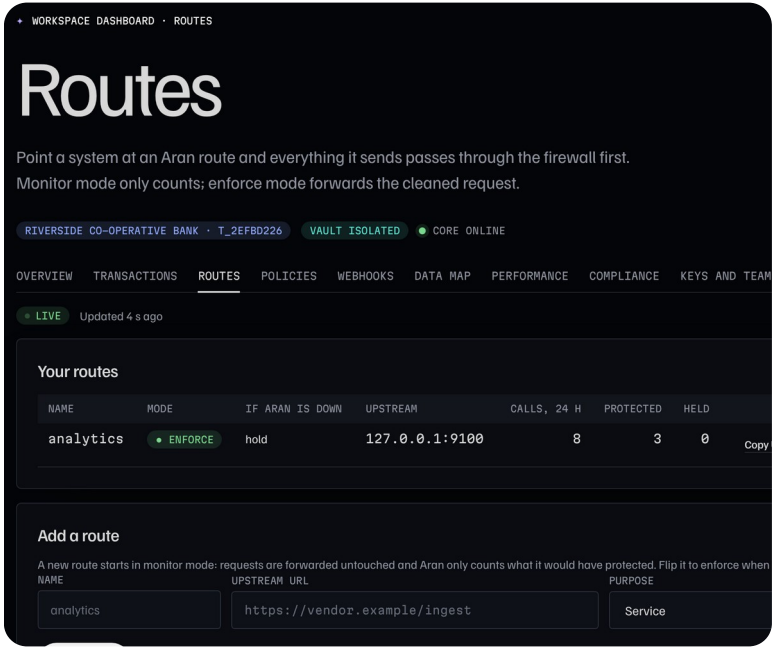

Leaks traced

Leaked files matched to the right one of 40 vendors

Firewall as a Service

Aran Cloud: any company signs up, gets a workspace and puts Aran in the path.

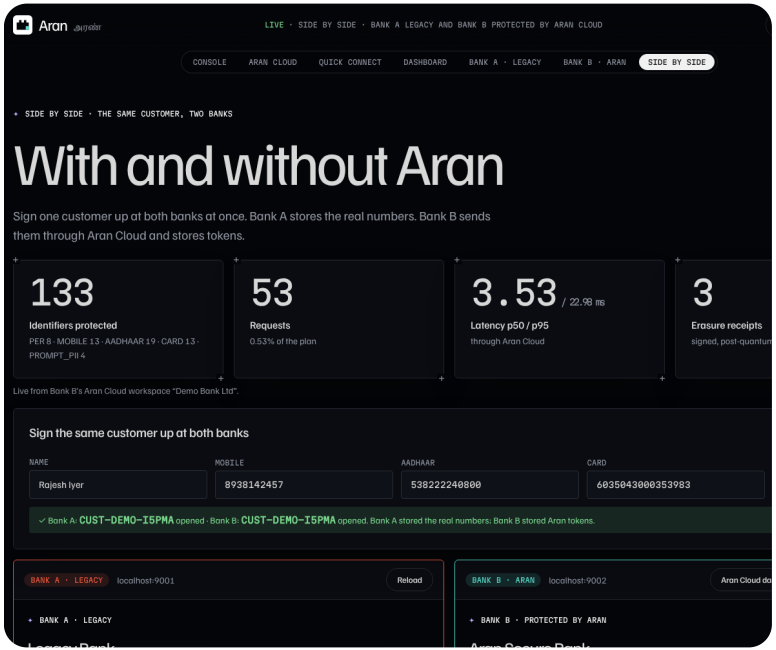

- Routes: point a system at Aran and it forwards the cleaned request
- Policies start in monitor mode, then switch to enforce
- Signed alerts to the security team, and a data plane that runs on site

Live Demo

Same customer, two sample firms: one keeps raw numbers, one uses Aran.

- Running now at aran-console.onrender.com
- Beat the firewall: judges try to slip data past it from their phones
- Guided tour in English, Tamil and Hindi

Market & Impact

6+

Sectors

Finance, health, telecom, retail, government and SaaS

₹250 cr

At stake

Top DPDP fine that every Indian data holder faces from 2027

0%

Numbers sent to AI

Identifier numbers reaching an AI provider in our test, down from 100%

What We Build Next

1

Built

Firewall core, AI layers, Aran Cloud, routes, policies and webhooks

2

Next

Faster engine for 10,000 lines a second, Postgres and more identifier types

3

Pilot

On-site data plane with a partner's consented logs, then re-measure
